We may receive commissions on purchases made from our chosen links. Pressure washers have many uses around your home, from cleaning decking and siding to washing cars, removing, cleaning grass equipment and more. The secret is at its tremendous power: while the average garden hose emits water at pressures below 40 psi, pressure washers, thanks to their gas or electric motors, fire water at an average of 1,000 psi to 3,000 psi, depending on the model. These versatile tools come in electric and gas versions —gas-powered models are typically more powerful—and a variety of sizes. To simplify the buying process, we researched the most popular pressure washers available today and then narrowed the choices to the best for the most important categories for the average owner. Here, the best pressure washers for your home: one of the best pressure washers on the market is the Simpson Cleaning MegaShot Gas Pressure Washer. This powerful machine houses a Honda GC190 engine for reliable power, and delivers an impressive 3,200 psi using 2.5 gallons per minute (also known as GPM), making it ideal for use in your home, driveway, patio furniture, car, painted surfaces and more. This pressure washer has a heavy welded steel structure and 10-inch pneumatic tires for added stability, and weighs at 55 pounds. The MegaShot is equipped with a 25-foot bend-resistant hose, a reliable OEM axial pump and ergonomic spray gun, and includes five stainless steel quick-connect nozzles for a variety of applications. This reliable, resistant and powerful gas-powered pressure washer is easy to set up and start. The Ryobi 3000 PSI Honda Pressure Washer is another top-rated model worth considering. With its Honda GCV160 gasoline engine, this pressure washer delivers 3,000 psi of force that will do a quick job of dirt, and dirt on sidewalks, fences, cars and other surfaces. It uses 2.3 gpm, and its 35-foot marring-free hose provides a long reach to those hard-to-reach areas. Unlike our top pick, the Ryobi pressure washer has a detergent tank on board for easy soap application, and its 5-in-1 nozzle offers maximum versatility. This pressure washer weighs 56 kilos, but is easy to carry thanks to its 12-inch wheels and hand truck design. It even has a quick release handle for easy storage. Electric washers are easier to maintain — no need to change — but the downside is that you have to be close to an electrical outlet. One of the highest rated electric models currently is the Sun Joe Electric Pressure Washer, which delivers 2,930 psi to 1.76 gpm. This affordable unit is equipped with double double Tanks, and it comes with five quick connection spray tips to help you handle all kinds of cleaning tasks. The Sun Joe Pressure Washer features a 20-foot-long high-pressure hose, a 34-inch extension wand, and a 35-foot power cord, and it even comes with a garden hose adapter. You can store two different types of detergent in the double chambers, alternating between them with the selection dial. This versatile power washer can be used for a variety of easy and difficult tasks—our testers have put you to work on siding, decking, cars, and more. We use it to clean our furniture from the balcony, some white pickets, sidings and a barbecue that we left outside all winter. The grate was covered with dirt and grease, and the Sun Joe cut through it with ease. Not too powerful, Sun Joe removed the surface dirt from our balcony and siding furniture without damaging it. — Kelly Hodgkins, Product Tester Want to wash your car without rubbing it by hand? A pressure washer like the Karcher K5 will do the job in no time. This electric power washer delivers up to 2,000 psi at 1.4 gpm, and has a detergent tank on board for easy soap application. The Karcher K5 has up to 40 times more pressure than a garden hose, and includes two wands — the Vario for daily cleaning and dirtblaster for hard work. The Karcher K5 has a water-cooled induction motor — a system that will help the engine live five times longer — and comes with a 25-foot high-pressure hose and a 35-foot power cord. This 32-pound pressure washer is a great choice for washing cars, trucks and SUVs, but can also be used in more difficult jobs such as cleaning sidewalks. You just need to deal with small jobs with your pressure washer? In this case, a more affordable model like Greenworks Pressure Washer will serve you very well. This economical model decreases power to 1,500 psi and 1.2 gpm, making it ideal for smaller projects such as cleaning patio furniture and washing your car. This lightweight electric pressure washer weighs just 17 pounds and includes a 35-foot power cord and a 20-foot high-pressure hose. It can be used vertically or horizontally for greater stability, and comes with quick connect tips of 25 and 40 degrees for different spray levels. It's a great value, but it's still powerful enough to clean siding, sidewalks and more. Gas pressure washers are typically more powerful than electric models due to their engines, and if you're looking for a top-rated gas model that packs a medium punch, the Simpson PowerShot Pro Gas Pressure Washer may be the best power washer for you. This heavy pressure washer delivers 4,400 psi to tackle even the toughest jobs at 4 gpm. This unit is powered from a 420 cc engine, and is made of solid steel for durability. The washer's twist and abrasion resistant hose is 50 feet long, and 1½-inch tires make it easy to wind on various terrains, such as pavement or grass. The PowerShot Pressure Washer comes with five fine nozzle tips that can be used for all types of applications, from wood restoration to graphite removal and everything else. To wash concrete and other surfaces that require serious energy, you need a model like the Champion Power Equipment Commercial Duty Gas Pressure Washer. Although not everyone needs such a high level of performance, for those who do, it is difficult to beat this professional-level machine. With water bursting at 4,200 psi and 4 gpm, thanks to the champion 389 CC premium engine, mud, engine grease, paint, and other resistant substances have no chance. The pressure washer features a 50-foot steel braided hose that is durable, not marring, and three times more abrasion resistant than rubber hoses. It has an AAA industrial triplex plunger pump that increases pressure on the nozzle to improve cleaning performance, and it is easy to direct the ergonomic spray gun and change the five ends of the quick connect nozzle. In addition, it has a built-in detergent tank for mess that require more than water alone. The solid steel structure will withstand up to years of rigorous use. This pressure washer is designed for professional contractors and cleaners who face all kinds of grunge and want it to go as fast as possible. Despite its heavy construction and energy, it is reasonably compact and easy to carry, however. Pressure washers can easily weigh 50 pounds or more, so if you're looking for a slightly lighter product to carry around your yard, you'll like the Ryobi 1,600 PSI Electric Pressure Washer. This smaller Ryobi unit weighs only 16 pounds, and is compact enough to store even in the most crowded garage or tool shed. This 1,600 psi electric power washer uses 1.2 gpm, and has a 35-foot power cord and a 20-foot hose. Includes three different nozzles, including a turbo nozzle for 50% faster cleaning. And despite its compact size, it's surprisingly powerful —great for use in cars, walkways, lawn tools, and more. To wash concrete and other surfaces that require serious energy, you need a model like the DeWALT 4400 PSI Gas Pressure Washer. This hard piece of machinery is designed for professionals, and with the help of its premium Honda GX390 engine, it can blow up dirt, dirt, paint and more with ease. This DEWALT Pressure Washer provides 4,400 psi to 4 gpm, and features a 50-foot steel braided hose that is durable, not marring, and three times more abrasion resistant than rubber hoses. It has an AAA industrial triplex plunger pump that increases pressure on the nozzle to improve cleaning performance, and it is easy to direct the ergonomic spray gun and change the five ends of the quick connect nozzle. Final Verdict The best pressure washer on the market is SIMPSON MegaShot Gas Pressure Washer (seen at Home Depot), which has a maximum psi of 3,200 and can tackle sidewalks, outdoor furniture, cars and more. However, if you are looking for something that is specifically intended for go with the Karcher K5 Premium Electric Power Pressure Washer (seen on Amazon). It has a built-in detergent tank, facilitating the washing of vehicles, by Cammy Rabideau Pressure washers are an incredibly useful tool to have at home. These machines amplify the energy of the garden hose, using water to explode all kinds of hard stains on a variety of surfaces. You can use a pressure washer to clean your car, remove it from the deck, remove oil from the sidewalk, wash the siding from your home, and more —without ever having to break a brush. How do pressure washers perform these tasks so easily? When connected to a hose, the machine uses gas or electricity to power a pump that amplifies water pressure by throwing water with 30 to 80 times more pressure than it would have from the hose. This force can effectively loosen dirt, dirt, paint, and more from a variety of surfaces, helping to streamline many of your household chores. Some models even have built-in soap tanks that blend with the spray for even more cleaning energy. However, buying a pressure washer can be a bit confusing, especially if you are not familiar with the common terminology. You will need to find a pressure washer with an appropriate water volume and cleaning force, measured in GPM and psi, respectively - to make this decision a little easier, pressure washers are often described as light, medium or heavy. In addition, you will have to choose between gas and electric options, each with pros and cons. The following guide will help you better understand the nuances of pressure washers by giving you the information you need to choose the best option for your home. There are several features you'll want to consider while buying a pressure washer. These factors will determine not only machine performance and what tasks it is best used, but also how expensive it will be. Water pressure: One of the most important factors to consider when buying a pressure washer is how much force it creates. After all, more pressure equates to more cleaning power. This pressure is measured in psi, or pounds per square inch. Generally speaking, lower psi means less pressure. However, this doesn't mean you should simply buy the tallest psi machine you can find —depending on how you plan to use your pressure washer, a lower psi may be perfect for your needs. Consumer pressure washers usually start around 1,300 to 1,800 psi. This kind of lightweight service machine is great for small residential jobs such as washing cars, cleaning blinds, washing grass furniture and cleaning or stains. The next step is around 2,000 to 3,000 psi, and these machines are often considered heavy as they can be used to clean of houses, sidewalks, decks and other difficult spots. Finally, machines with more than 3,000 psi are considered professional-level and are used for industrial cleaning, joint peeling, graphite removal and these high pressure washers are the most expensive, and in general, most homeowners don't need as much power. Gallons per minute: The other key factor that walks hand in hand with psi is GPM, or gallons per minute. As you may have guessed, this takes the volume of water that passes through the pressure water. Models with a higher GPM will clean faster and more effectively as they are using more water. GPM is directly correlated with psi — the higher the pressure, the more water the machine will use per minute. Lightweight service machines can only use 1.5 gpm, while professional level models can reach up to 4 gpm. When buying a pressure washer, you'll want to look at psi first, but keep an eye on the GPM, too. Depending on what you are using for a water source, you may not be able to support a high gpm machine. Power source: You will also want to see how different pressure washers are fed. There are gas and electrical models available, and each of these styles has its own pros and cons. Electricity-driven pressure washers are typically cheaper, lighter and easier to maintain. Moreover, they run quieter and do not create any harmful air pollution. However, electrical models are generally less powerful than gas models, and you have to use them near an electrical outlet. This type of pressure washer is often best for small jobs around the house, such as car cleaning, patio furniture and barbecues. The other option is a gas-powered pressure washer. These machines are much more powerful, and since you are not confined by a cable, they are more portable and versed. The disadvantage is that gas machines need regular maintenance, and are getting worse for the environment. Pump type: The pressure washer pump is undoubtedly the most important part of your tool as it is what creates the high water pressure. There are two types of pumps that are commonly used: axial pumps and triplex pumps. Axial pumps are great for beginners as they are easy to use and require little maintenance. They are best for small tasks around the house and ideal if you only plan to use your pressure washer from time to time. Triplex pumps, on the other hand, are a little heavier and will serve you well if you plan to use your pressure washer frequently. However, these pumps require more maintenance. Water Source: What type of water source are you planning to hook your pressure machine? Municipal water? Good water? Maybe you don't have a water fountain! This is an essential - but sometimes overlooked - consideration when buying a pressure washer, as the machine's GPM must be equal to the pressure of your water supply. For example, if you buy a pressure washer that uses 2.5 gpm, your water supply needs to be able to consistently supply Water. Otherwise, you will probably burn the engine of your new tool. In general, most pressure washers can be safely performed in a city water supply, but the same cannot be said about well water. If you plan to plan Ensure the machine from the pressure to the water well supplied, you will want to measure the GPM to ensure that it can withstand the needs of the machine for as long as you are using. What if you don't have water? You have a few options. First, you could invest in some kind of water tank to run your machine off. Secondly, there are some small pressure washers that have built-in water reservoirs that you can fill in the sink or shower. Keep in mind that both options will give you a limited run time. Noise: Some pressure washers are noisier than others. If you have neighbors around, you might want to opt for a quieter version—electric pressure washers are typically much quieter than gas, as their engines run silently. Portability: Do you plan to use your pressure washer around the house? Or will you take it to various workplaces, too? There are several features that affect the portability of a pressure washer. First, the weight of the machine will dictate how easy it is to carry. In addition, some models have wheels that make it easy to move from one place to place. Cable Length: If you are planning to buy an electric pressure washer, be sure to look at how long your power cord has and whether it is compatible with extension cords, and this means that you will be limited to the length of the existing power cord. Soap Tank: Depending on how you use your pressure washer, it may be beneficial to find a model with a built-in soap tank. This will allow you to simultaneously spray water and soap on surfaces for a more complete washing job. However, if you plan to use your washer to remove paint and clean sidewalks, you may not need a soap tank. There are several types of pressure washers to consider how you plan to use. Gas-powered: As discussed above, gas-powered pressure washers are powerful and portable. They are great for handling larger jobs such as washing sidings or cleaning sidewalks, but they are also noisier and require more maintenance. Gas pressure washers usually start at around \$200 for low-end models, and they can range above \$2,000 for commercial-level options. Electricity: Pressure washers that run on electricity are generally lighter and quieter. They are great for small jobs around the house, as they usually have a lower psi and gpm. However, they are not as powerful as gas models, and when using them, you are limited by the length of the power cord. Electric pressure washers are some of the cheapest options, starting below \$100 and reaching about \$300. Light Duty: Pressure washers are categorized as light, medium, or heavy, and this describes the types of jobs they may face. Lightweight models typically have a psi below 1,800, and they can be used for small jobs such as washing cars and boats and cleaning patio furniture. These models are typically electric, and will cost between \$50 and \$200. Average Average The next step is medium-sized machines, which have between 2,000 and 2,800 psi. These pressure washers are useful if you want to clean the siding of your home, remove dirt from a fence, or clean the mold from your deck. These mid-line options are undoubtedly the most popular among owners thanks to their versatility, power and relatively affordable prices. Most medium service pressure washers are gas powered, but there are some electric models, too. You can pay from \$200 to \$500 for this type of machine. Heavy Duty: Heavy pressure washers are over 2,800 psi, and are used to tackle the biggest and most difficult jobs, such as preparing houses for painting, cleaning sidewalks and washing second-floor exteriors. These are the most expensive models, costing from \$500 to several thousand. Multi-Duty: Most pressure washers operate at a psi and that's it. However, if you are willing to spend more, you can get a multi-duty or all-in-one pressure washer, which allows you to adjust the pressure flow to suit various tasks. These units start at around \$400 and are usually gas-fed.Commercial: You may come across some pressure washers over 3,500 psi. These units are designed for commercial or professional use. Some applications include ink peeling, graphite removal and industrial cleaning. These units will cost \$500 or more, and are often unnecessary for homeowners. Hot Water: Most pressure washers use cold water, but you do actually clean more efficiently with hot water. As such, there are certain models that heat the water before siving it. The downside is that hot water pressure washers are very expensive, costing \$2,000 or more. As such, they are typically used only for agricultural and industrial purposes. As you buy a pressure washer, you'll probably come across several well-known brands. Karcher: Karcher pressure washers are some of the most popular thanks to their innovative features. This company offers electric and gas models, and its electric models are designed to be greener. A unique feature of some Karcher models is the four-wheel ed Follow Along design. DeWalt: This well-known tool brand offers some pressure washer models, most of which are gas powered. The DeWalt pressure washers are known for their power and performance, but many of these models are extremely high-end, costing \$1,000 or more. Simpson: Simpson is a manufacturer of pressure washers, and while some of its machines are sold under the DeWalt and Briggs&amp; Stratton brands, the company also sells its own line of tools. Simpson pressure washers are recognized as a great value because they are well made machines without the price marking that comes with a brand as well Generac: Generac offers gas-fired high-power pressure washers starting at about \$400. This company designs and manufactures many of its engines, and its brands have some of the highest average customer ratings. Ryobi: Ryobi: it offers electric and gas pressure washers, and their electric models are a little more expensive than other brands thanks to high quality fittings and hoses that are designed to make them perform better and last longer. Another household tool name, Craftsman makes electric and gas-powered pressure washers. However, their gas models are known to perform better and be more reliable than electric ones. Sun Joe: Sun Joe may be a more affordable-pressure washer brand, but don't count yet. This brand sells several electric powered models that are highly rated by the owners who use them for basic tasks around the house. There are several accessories that you can buy for your new pressure washer to upgrade your machine. For example, you can find new fittings and new hoses to replace cheap parts in cheap models—this will help ensure your pressure washer performs best and lasts longer. Perhaps some of the most popular pressure washer accessories are new nozzles or spray tips. There are specially designed nozzles that change the size and intensity of the spray, allowing you to tackle more accurate jobs or cover more area at once. As an added bonus, these additional nozzles or spray tips are usually quite affordable. Another popular accessory is the surface cleaner. This accessory features a round deck on wheels, typically equipped with rotating spray nozzles, which allows you to clean a variety of floor surfaces quickly and efficiently. In addition, there are a variety of other pressure washer accessories such as brushes and surface cleaners that can help you handle specific jobs. Jobs.
